

Figure 1: Causal diagram of the seed amplification effect. The diagram illustrates the relationships between various variables and their effects on the Core Hub and W_slow variables. The variables are: Encoding Order, Seed Quality, Replay Events, Core Hub, W_slow [uc], W_slow [uu], and W[cc] fast. The diagram shows the following causal pathways and correlations:

- Encoding Order → Seed Quality (Causal pathway)
- Seed Quality → Core Hub (Causal pathway, 0.8%)
- Seed Quality → W_slow [uc] (Causal pathway, 0.5%)
- Replay Events → Core Hub (Causal pathway, 0.5%)
- Replay Events → W_slow [uc] (Causal pathway, 0.5%)
- Replay Events → W[cc] fast (Causal pathway, 0.5%)
- Core Hub → W_slow [uc] (Causal pathway, 0.5%)
- Core Hub → W_slow [uu] (Causal pathway, 0.5%)
- W_slow [uc] → W_slow [uu] (Causal pathway, 0.5%)
- W[cc] fast → W_slow [uu] (Causal pathway, 17.5%)

The diagram also includes a legend for the types of relationships:

- Causal pathway
- - Correlate (non-causal)
- ✗ Null result
