

Serial Position Effect from Synaptic First Principles

RGCC model: W_{fast} -> recency; W_{slow} -> primacy; γ -> crossover timing
(mean +/- 95% CI across 10 seeds)

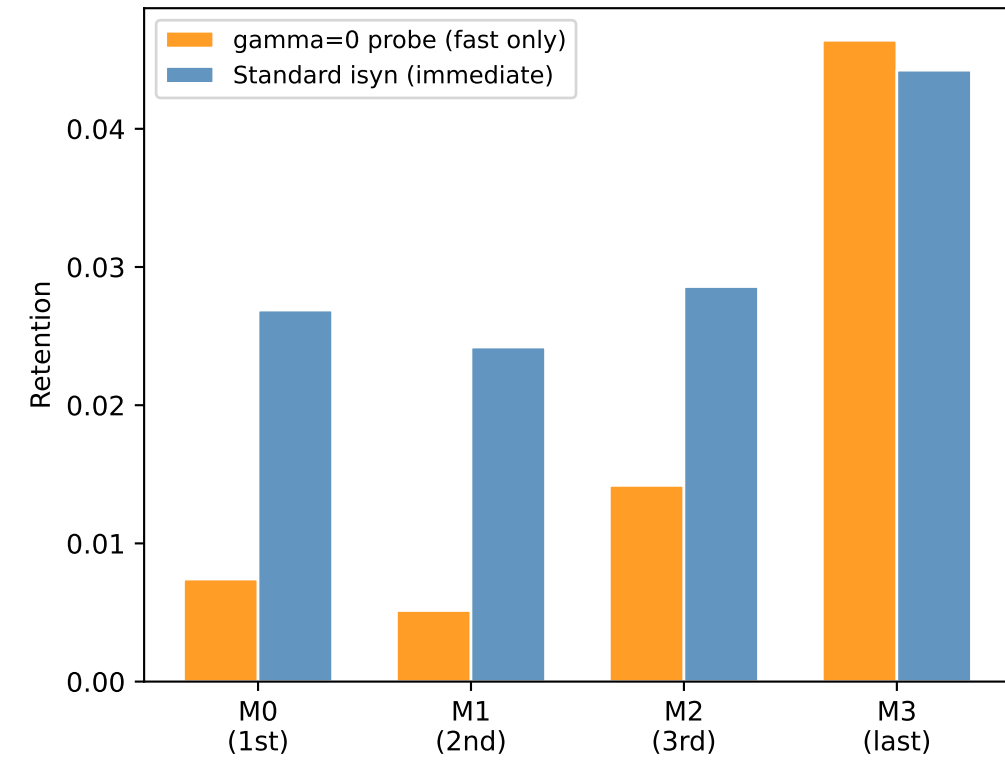

A. Consolidation dynamics

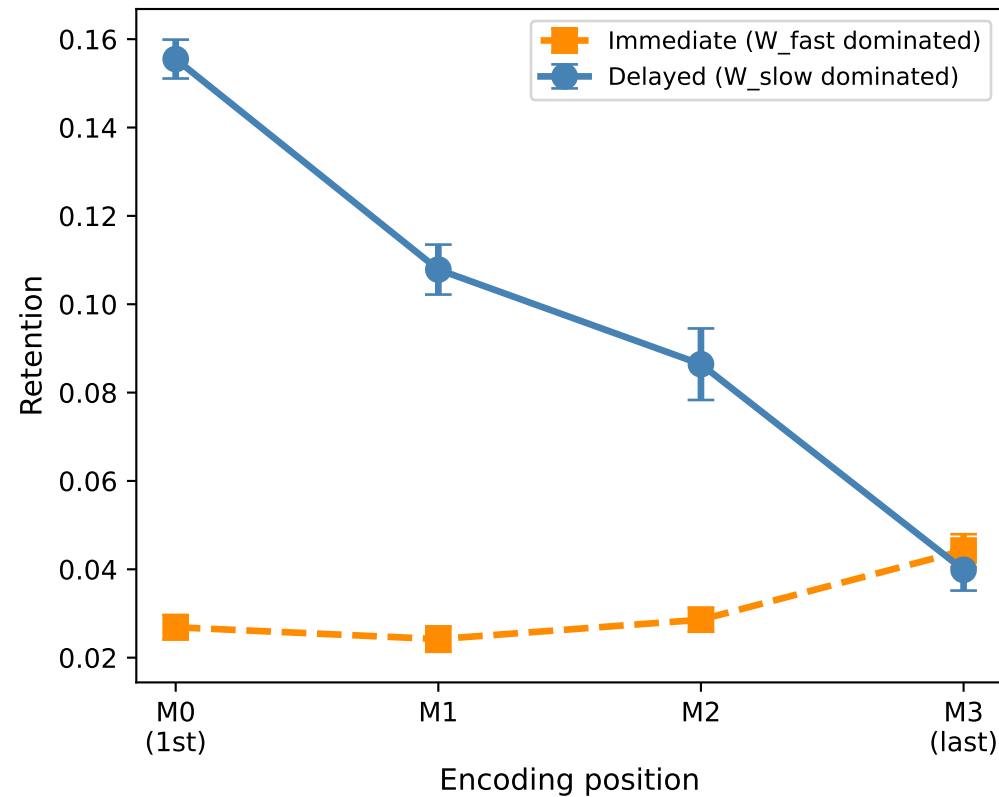

B. Fast weight dynamics

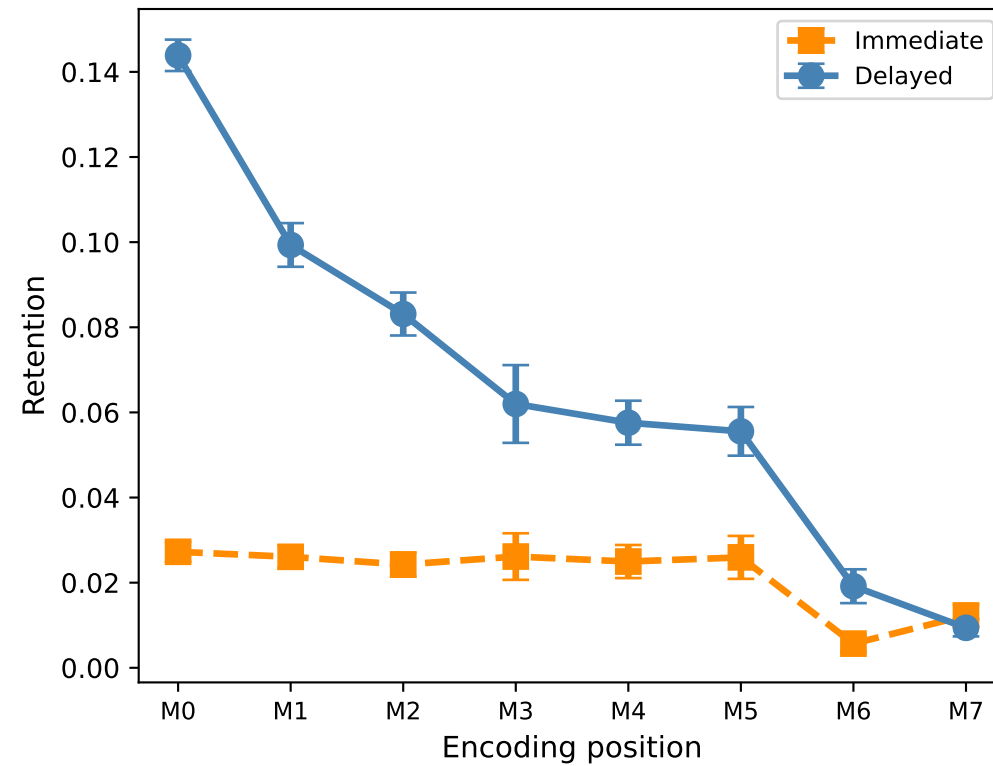

C. Synaptic decomposition
($\gamma=0$ vs standard readout)

D. Serial position curves
(4 memories, 10 seeds)

E. Serial position curves
(8 memories, 10 seeds)

F. Position-to-consolidation law
 $E[ret(k)] = \alpha + \beta \cdot (H(N) - H(k))$
